## Ignition lead sets – marking, technical specifications

TESLA ignition lead sets are made of different types of cables. Their basic construction and parameters are described below. The sets comply with the ISO 3808, ISO 6856 and SAE J2031 international standards. All TESLA sets meet the EMC requirements according to ECE R10.

TESLA part numbers (e.g. T001B) are used to identify required ignition lead sets (application and construction used). The part numbers are also used as ordering numbers / references.

### Resistive core

Ignition cables consist of a core, inner insulation and outer jacket. The conductive silicone core (1) is formed by carbon impregnated glass fibre bundle cord (a), covered with conductive latex coating (b), and by conductive silicone layer (c) of a defined thickness. The special cord ensures high tension strength and stability while the conductive silicone ensures maximum efficiency of both energy transmission and suppression. The inner insulation (2) provides superior heat resistance and dielectric strength while the tape braiding (3) adds strength and flexibility. The outer silicone jacket (4) protects the cable from the working environment under the bonnet. Ignition leads are equipped with various types of terminals on each end. The terminals are covered by silicone rubber boots for insulation and protection against the working environment under the bonnet. Shapes of these components correspond to the OE requirements.

### Copper core

Ignition cables consist of a core, inner insulation and outer jacket. The copper core (1) guarantees a loss-free transmission of energy over the cable and consists of stranded tin plated copper wires. The inner insulation (2) provides superior heat resistance and dielectric strength while the tape braiding (3) adds strength and flexibility. The outer silicone jacket (4) protects the cable from the working environment under the bonnet.

The suppression is carried out by a suppression resistor implemented in the body of suppressed spark plug boot and coil (distributor) boot connectors. The spark plug boot connectors are often shielded by a metal plate for higher heat and mechanical protection. The typical value of the resistor element is 1 or 5 kΩ.

### Inductive core

Ignition cables consist of a core, inner insulation and outer jacket. The inductive core (1) consists of a kevlar cord (a), a ferrite loaded conductive layer (b) and thin stainless steel wire (c) wound over the substrate fixed by sprayed coating (d). The kevlar cord ensures excellent tension strength and stability while the winding with the substrate ensures maximum efficiency of energy transmission with suppression. The inner insulation (2) provides superior heat resistance and dielectric strength while the tape braiding (3) adds strength and flexibility. The outer silicone jacket (4) protects the cable from the working environment under the bonnet. Ignition leads are equipped with various types of terminals on each end. The terminals are covered by silicone rubber boots for insulation and protection against the working environment under the bonnet. Shapes of these components correspond to the OE requirements.
